

Morgan Ellis

Staff Engineer · Seattle, WA · morgan.ellis@example.com · (206) 555-0187 · github.com/mellis-eng

Summary

Staff engineer with fifteen years of experience across infrastructure, data and product engineering. This document is intentionally long so the analyzer must truncate it before sending it to the AI.

Experience

Platform Engineer, Contoso Cloud — 2000 – 2001

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Site Reliability Engineer, Fabrikam Retail — 2001 – 2002

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Backend Engineer, Tailspin Travel — 2002 – 2003

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Data Engineer, Wide World Importers — 2003 – 2004

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Platform Engineer, Adventure Works — 2004 – 2005

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.

- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Site Reliability Engineer, Litware Labs — 2005 – 2006

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Backend Engineer, Proseware Health — 2006 – 2007

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Data Engineer, Lucerne Publishing — 2007 – 2008

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Platform Engineer, Northwind Traders — 2008 – 2009

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Site Reliability Engineer, Coho Winery — 2009 – 2010

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.

- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Backend Engineer, Alpine Ski House — 2010 – 2011

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Data Engineer, Blue Yonder Airlines — 2011 – 2012

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Platform Engineer, Graphic Design Institute — 2012 – 2013

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Site Reliability Engineer, Humongous Insurance — 2013 – 2014

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Backend Engineer, Margie's Travel — 2014 – 2015

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.

- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Data Engineer, Trey Research — 2015 – 2016

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Platform Engineer, Woodgrove Bank — 2016 – 2017

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Site Reliability Engineer, Southridge Video — 2017 – 2018

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Backend Engineer, Fourth Coffee — 2018 – 2019

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.
- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Data Engineer, Relecloud — 2019 – 2020

- Designed and operated a multi-region service mesh that carried 9,000 requests per second with 99.95% availability across three cloud regions.
- Rewrote the deployment pipeline so that every merge to main reached production in under fifteen minutes, with automatic rollback on failed health checks.
- Partnered with product managers and designers to scope quarterly roadmaps, estimate delivery dates and communicate trade-offs to stakeholders.
- Introduced structured logging and distributed tracing, which shortened the median time to diagnose production incidents from hours to minutes.

- Ran blameless postmortems for 30 incidents and tracked every follow-up action to completion in the team's planning tool.
- Migrated legacy cron jobs to an event-driven architecture using queues and idempotent consumers, removing a nightly batch window entirely.

Education

M.S. Computer Science, University of Washington — 2009

Skills

Go, Rust, Java, Python, SQL, Kubernetes, Terraform, Kafka, Spark, PostgreSQL, Cassandra

Volunteering

Final section of the long resume: LONGRESUMETAILMARKER mentoring at a coding bootcamp every weekend.
